Example #2  

Warm Up

Warm Up Sort Letters

<https://theweeklychallenge.org/blog/perl-weekly-challenge-279>

Task 1: Sort Letters

You are given two arrays, `@letters` and `@weights`.

Write a script to sort the given array `@letters` based on the `@weights`.

Example 1

```
Input: @letters = ('R', 'E', 'P', 'L')
       @weights = (3, 2, 1, 4)
Output: PERL
```

Example 2

```
Input: @letters = ('A', 'U', 'R', 'K')
       @weights = (2, 4, 1, 3)
Output: RAKU
```

Example 3

```
Input: @letters = ('O', 'H', 'Y', 'N', 'P', 'T')
       @weights = (5, 4, 2, 6, 1, 3)
Output: PYTHON
```

3 2 1 4
R E P L

[[digression]]

Conor Hoekstra @code_report · Jan 8, 2022

Also, I apologize for my above average number of tweets 🐦 today, but this table of Greek/Latin words for describing function **arity** will be necessary for a future talk.

The \hat{E} combinator is "tetradic"

Unary/Monadic

Binary/Dyadic

Ternary/Triadic

Quaternary/Tetradic

Terminology [\[edit\]](#)

[Latinate](#) names are commonly used for specific arities, primarily based on [cardinal numbers](#) or [ordinal numbers](#). For example, 1-ary is based on

| x-ary | Arity (Latin based) | Adicity (Greek based) |
|-------|--------------------------------------|-----------------------|
| 0-ary | <i>Nullary</i> (from <i>nūllus</i>) | <i>Niladic</i> |
| 1-ary | <i>Unary</i> | <i>Monadic</i> |
| 2-ary | <i>Binary</i> | <i>Dyadic</i> |
| 3-ary | <i>Ternary</i> | <i>Triadic</i> |
| 4-ary | <i>Quaternary</i> | <i>Tetradic</i> |

 Companies

 Hint

An array is considered **special** if every pair of its adjacent elements contains two numbers with different parity.

You are given an array of integers `nums`. Return `true` if `nums` is a **special** array, otherwise, return `false`.

Minimum Average

<https://leetcode.com/problems/minimum-average-of-smallest-and-largest-elements>

3194. Minimum Average of Smallest and Largest Elements

Easy

Topics

Companies

Hint

You have an array of floating point numbers `averages` which is initially empty. You are given an array `nums` of `n` integers where `n` is even.

You repeat the following procedure $n / 2$ times:

- Remove the **smallest** element, `minElement`, and the **largest** element `maxElement`, from `nums`.
- Add $(\text{minElement} + \text{maxElement}) / 2$ to `averages`.

Return the **minimum** element in `averages`.
